The Restful Jaw Product Description (146 words)

The Restful Jaw® is a FDA-registered external chin support device. This newest and noninvasive product is clinically proven to minimize patient jaw pain during dental treatment.

The device's memory foam cushion supports the mandible from underneath (so you don't have to) and allows the patient to relax their jaw while still holding their mouth wide open.

Clinical benefits include:

- Shorter chair time with increased stability and reduced treatment breaks.
- Mandible stability and comfort helps keep patients still, helping clinicians maintain correct posture.
- Reduced jaw injury, locking, overextension, and other potential medicolegal risks.

Indications include:

- Any long procedures.
- TMD patients: Symptomatic and subclinical.
- Procedures that put significant force on jaw like extractions.
- Movement disorders: MS, Parkinson's.
- Geriatric and special needs.
- Conscious sedation.

The Restful Jaw was invented by Eric Schiffman, D.D.S., M.S., an international expert in TMD diagnosis and treatment.
